

Spectrogram data augmentation

(A) Standard augmentation

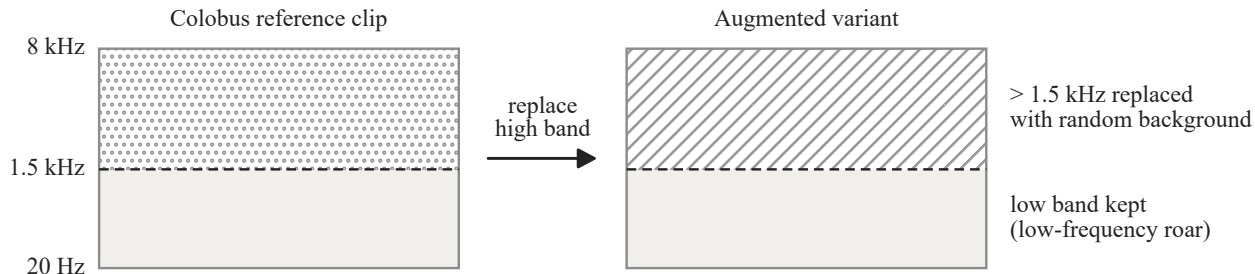

four operations cycled to 3,000 per class, all target classes

cycled in this order until the class reaches 3,000 examples

(B) High-frequency nuisance augmentation

+2× per reference clip, Colobus guereza only — in the released code, not in the packed set measured here

Decorrelates high-frequency texture from the Colobus label; not applied to Cernic, whose calls occupy higher frequencies.
